5.8.4 Function Documentation

5.8.4.1 `yaml_parser_delete (yaml_parser_t * parser)`

Destroy a parser.

Parameters

<code>in, out</code>	<code>parser</code>	A parser object.
----------------------	---------------------	------------------

5.8.4.2 `yaml_parser_initialize (yaml_parser_t * parser)`

Initialize a parser.

This function creates a new parser object. An application is responsible for destroying the object using the [yaml_parser_delete\(\)](#) function.

Parameters

<code>out</code>	<code>parser</code>	An empty parser object.
------------------	---------------------	-------------------------

Returns

1 if the function succeeded, 0 on error.

5.8.4.3 `yaml_parser_load (yaml_parser_t * parser, yaml_document_t * document)`

Parse the input stream and produce the next YAML document.

Call this function subsequently to produce a sequence of documents constituting the input stream.

If the produced document has no root node, it means that the document end has been reached.

An application is responsible for freeing any data associated with the produced document object using the [yaml_document_delete\(\)](#) function.

An application must not alternate the calls of `yaml_parser_load()` with the calls of `yaml_parser_scan()` or `yaml_parser_parse()`. Doing this will break the parser.

Parameters

in, out	<i>parser</i>	A parser object.
out	<i>document</i>	An empty document object.

Returns

1 if the function succeeded, 0 on error.

5.8.4.4 `yaml_parser_parse (yaml_parser_t * parser, yaml_event_t * event)`

Parse the input stream and produce the next parsing event.

Call the function subsequently to produce a sequence of events corresponding to the input stream. The initial event has the type `YAML_STREAM_START_EVENT` while the ending event has the type `YAML_STREAM_END_EVENT`.

An application is responsible for freeing any buffers associated with the produced event object using the `yaml_event_delete()` function.

An application must not alternate the calls of `yaml_parser_parse()` with the calls of `yaml_parser_scan()` or `yaml_parser_load()`. Doing this will break the parser.

Parameters

in, out	<i>parser</i>	A parser object.
out	<i>event</i>	An empty event object.

Returns

1 if the function succeeded, 0 on error.

5.8.4.5 `yaml_parser_scan (yaml_parser_t * parser, yaml_token_t * token)`

Scan the input stream and produce the next token.

Call the function subsequently to produce a sequence of tokens corresponding to the input stream. The initial token has the type `YAML_STREAM_START_TOKEN` while the ending token has the type `YAML_STREAM_END_TOKEN`.

An application is responsible for freeing any buffers associated with the produced token object using the `yaml_token_delete` function.

An application must not alternate the calls of `yaml_parser_scan()` with the calls of `yaml_parser_parse()` or `yaml_parser_load()`. Doing this will break the parser.

Parameters

in, out	<i>parser</i>	A parser object.
out	<i>token</i>	An empty token object.

Returns

1 if the function succeeded, 0 on error.

5.8.4.6 `yaml_parser_set_encoding (yaml_parser_t * parser, yaml_encoding_t encoding)`

Set the source encoding.

Parameters

<code>in, out</code>	<code>parser</code>	A parser object.
<code>in</code>	<code>encoding</code>	The source encoding.

Parameters

<code>in, out</code>	<code>parser</code>	A parser object.
<code>in</code>	<code>handler</code>	A read handler.
<code>in</code>	<code>data</code>	Any application data for passing to the read handler.

5.8.4.8 `yaml_parser_set_input_file (yaml_parser_t * parser, FILE * file)`

<code>in, out</code>	<code>parser</code>	A parser object.
<code>in</code>	<code>file</code>	An open file.

5.8.4.9 `yaml_parser_set_input_string (yaml_parser_t * parser, const unsigned char * input, size_t size)`

Set a string input.

Note that the `input` pointer must be valid while the `parser` object exists. The application is responsible for destroying `input` after destroying the `parser`.

Parameters

<code>in, out</code>	<code>parser</code>	A parser object.
<code>in</code>	<code>input</code>	A source data.
<code>in</code>	<code>size</code>	The length of the source data in bytes.

evaluate the function at the current value of par.

if the function is small enough, accept the current value of par. Also test for the exceptional cases where par1 is zero or the number of iterations has reached 10.

compute the Newton correction.

depending on the sign of the function, update par1 or paru.
